Dear Haystack Team,

The hardest part of the AI assistant I designed at H-E-B wasn't the model. It was the moment a support rep, with a frustrated customer on the line, had to decide whether to trust what the assistant was suggesting. We designed it as a guided flow, one step at a time with the rep confirming before anything happened, and in prototype testing every rep finished their case. That's the problem I think your Product Designer role is really about.

From what I can see, Haystack sits between developers and the code their agents produce, which means your users spend most of their time reviewing work they didn't write. I've been living a small version of that lately: I build my own site and client sites with Claude Code and Codex, and the moments I slow down are always the same ones, when I can't tell what changed, why, or what the agent was allowed to touch. Designing the review and permission states so that answer is obvious at a glance feels like the center of this job, and it's the part I'd want to own.

Most of my work has been for people in the middle of a busy day: H-E-B associates, small-business buyers at Dell, campers booking a site on RoverPass. The pattern is the same each time. Interview people, map how they actually decide, then design a flow that fits that instead of asking them to learn a new one. Developers are a different audience, but the instinct to go sit with them before sketching carries over.

I'd be glad to walk through the H-E-B assistant or anything I've built with agents, and I'd love to hear how your team thinks about trust in the review step. Thanks for reading.

Best,
Marcos Rios
