Dear Cala Health Hiring Team,

Your posting asks for a designer who can run formative and summative usability testing and carry the findings all the way into the product. That's the part of design I've spent the most time on, and the kIQ Plus is the kind of product where it matters most: the person using it has a hand tremor, and the app has to work for exactly that hand.

Earlier this year I redesigned the homepage for Lino's Pharmacy, a small pharmacy near the Texas border, so patients could find and use Pablo, its text-and-phone assistant, for refills and medication questions. I wrote the test tasks, ran sessions in English and Spanish, and watched where people hesitated. Seven of ten completed a text or call task in the first round, and the three who didn't told me more than the seven who did. The instructions got shorter, the buttons got bigger, and the next version was built around what people actually tried to tap.

At H-E-B I did the same work at larger scale, running interviews, workshops, and usability tests with support associates and designing a guided AI assistant inside their Salesforce tools. Every participant completed their tasks in prototype testing. And at Dell I wrote the specs and reviewed implemented screens during the build, so documenting a design carefully enough that someone else can verify it is habit, not a chore.

I noticed the kIQ Plus calibrates to a person's tremor before each session. That's a quiet, respectful piece of design, and it suggests a team that thinks about the user's body as part of the interface. I'd like to help with the screens around it. Thanks for taking the time, and I'd be glad to talk.

Warmly,
Marcos Rios
