Dear Skyward IT Solutions Hiring Team,

Your posting for a Product Designer on the CMS enterprise AI platform asks for someone who can take AI-driven workflows from concept to high-fidelity design, with hands-on research and a design system behind it. The closest thing I've done is a guided AI assistant for H-E-B's support associates, built inside the Salesforce tools they use on live calls. I interviewed associates and managers, mapped how they actually decided a missing-delivery or coupon case, and designed the flow and the on-screen wording with a content designer and a developer. Every participant completed their tasks in prototype testing.

The part of that project I'd carry into CMS work is the trust layer. An assistant that's right most of the time still has to show its reasoning so a person can check it, and a federal workflow raises that bar: the reviewer may be auditing a decision months later. We built the H-E-B assistant as a guided flow where the associate confirmed each step, and I'd want to start from that same principle on your platform.

Two other pieces of my background fit. I spent two years with the City of Hutto, Texas, leading a rebrand informed by resident interviews and designing public programs, so I know what it's like to design inside government review cycles and plain-language expectations. And I grew up in Roma, on the Texas–Mexico border, translating forms and appointment calls for family. The people CMS serves are not abstract to me, and I keep them in mind when a screen is clearer for the agency than for the person on the other end.

From what I can see, Skyward's CMS work leans on multi-agent systems, which makes the review and hand-off states between agents and people a central design problem. I'd be glad to walk through the H-E-B assistant in detail. Thanks for reading.

Sincerely,
Marcos Rios
